Project: DOMAIN SPECIFIC SMALL LANGUAGE MODEL FOR LEGAL ADVICE

Project Domain: TAX LAW

Problem Statement

Nigeria's 2026 tax reforms introduced a new legal framework that many individuals, small businesses, and tax practitioners struggle to interpret due to limited official guidance and outdated public resources. General-purpose AI models often rely on repealed tax laws, producing inaccurate responses that can lead to regulatory non-compliance, financial penalties, and reduced trust in AI systems. This project investigates whether a domain-specific language model trained exclusively on current Nigerian tax legislation and official guidance can provide accurate, reliable, and explainable tax assistance for common tax compliance issues. The solution will be guided by the principles of **accuracy, fairness, transparency, privacy, inclusivity, safety, reliability, and explainability** to ensure trustworthy and accessible guidance. Ultimately, the project aims to improve access to reliable tax information, promote voluntary compliance, and support the responsible use of AI in Nigeria's legal and regulatory environment.
